

HelpDock AI Security and SLA Brief

Demo knowledge source for questions about security, data handling, retention, and response commitments.

Data Handling

Uploaded source documents are stored in a private Supabase Storage bucket named source-documents. Application CRUD access uses server-side API routes and a service-role client; browser components do not call Supabase tables directly.

Document chunks are scoped by workspace and bot. Retrieval must call the match_document_chunks function with workspace and bot context so one workspace cannot retrieve another workspace's knowledge.

Retention Policy

Deleted documents should remove the document row, related chunks, and the stored source file. Demo workspaces keep conversations until a user starts over or deletes the bot.

SLA Targets

Plan	Support response	Ingestion expectation
Free	2 business days	Small files processed on a best-effort demo queue
Pro	1 business day	Standard documents usually process within a few minutes
Business	4 business hours	Priority-style demo limits for larger review flows

Security Demo Questions

Useful reviewer questions include: Where are uploaded source documents stored? How is retrieval scoped? What happens when a document is deleted? What is the Business plan support response target?

Known Demo Limitations

This MVP uses test billing or mock upgrades, requires a Gemini API key for AI responses, and is intended for demo-scale ingestion rather than production data volumes.
